Biol. 21:239-248(1993).
-1- PTM: Five disulfide bonds are present (By similarity).
-1- ALLERGEN: Causes an allergic reaction in human.
-1- SIMILARITY: Belongs to the cereal trypsin/alpha-amylase inhik
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         01-0CT-1989 (Rel. 12, Created)

-!- FUNCTION: Catalyzes a salvage reaction resulting in the form of AMP, that is energically less costly than de novo synthes of AMP, that is energically less costly than de novo synthes -!- CATALYTIC ACTIVITY: AMP + diphosphate = adenine + 5-phospho-1- PATHWAY: Putrine salvage.
-!- PATHWAY: Putrine salvage.
-!- SUBCNIT: Homodimer (By similarity).
-!- SUBCNITARITY: Belongs to the putrine/pyrimidine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. Sci. U.S.A. 100:5455-5460(2003).

Digests double-stranded RNA. Involved in the processing nal RNA precursors and of some mRNAS (By similarity).

ACTIVITY: Endonucleolytic cleavage to 5'-

10051cr.

Y. Contains I DRBM (double-stranded RNA-binding) domain.

Y: Contains I RNASe III domain.
                                                                                                                                                                                                        Gaps

PORCE W.R., Todd P.K., Mikayama T.;
Mouse LIGHT; molecular genetics, ligand binding and expression.
Submitted (JAN-2000) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Cytckine that binds to TWRSF3/LTBR. Binding to th
decoy receptor TWFRSF6B modulates its effects. Activates NFK
and stimulates the proliferation of T cells.
-!- SUBUNIT: Homotrimer (By similarity).
-!- SUBCELIULAR LOCATION: Type II membrane protein and secreted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This SWISS-PROT entry is copyright. Schackwitz W.S., Shrowold J.K., Witrak L.A., Nickerson D.A.; Submitted (JAN-2003) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Cytokine that binds to LTBR/TMFRSF3. May play a sproll in immune response regulation. Provides the membrane and for the attachment of the heterotrimeric complex to the cell surface. Isoform 2 is probably non-functional.

-!- SUBUNT: Heterotrimer of either two LTB and one LTA subunits (less prevalent) one LTB and two LTA subunits.

-!- SUBCELLULAR LOCATION: Type II membrane protein (Potential).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright. Cytokine that binds to LTBR/TMFSRF3. May play a specific mmune response requiation. Provides the membrane anchor stachment of the heterotrimeric complex to the cell 3y similarity).

Jeterotrimer of either two LTB and one LTA subunits or valent) two LTA and one LTB subunits (By similarity).

AR LOCATION: Type II membrane protein (Potential).

F: Belongs to the tumor necrosis factor family.

Rhabditidae, Peloderinae, Caenorhabditis.
lipoamide dehydrogenase (E3).
-!- FUNCTION: THE B.SUBTILIS PDH COMPLEX POSSESSES ALSO BRANCHED-
2-OXOACID DEHYDROGENASE (BCDH) ACTIVITY.
-!- CATALYTIC ACTIVITY: Pyruvate + lipoamide = S-
acetyldihydrolipoamide + CD(2).
-!- COFACTOR: Thiamine pyrophosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Submitted (JAN-1995) to the EMBL/GenBank/DDBJ databases.
-!- SUBCELLULAR LOCATION: Integral membrane protein (Potential)
-!- SIMILARITY: BELONGS TO THE C.ELEGANS RECEPTOR-LIKE PROTEIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2.5%; Score 7; DB 1; Length 324; 100.0%; Pred. Biochem. 109:852-857(1991).
-!- FUNCTION: Caralyzes the oxidation of 3-carboxy-2-hydroxy-4-methylpentanoate (3-isopropylmalate) to 3-carboxy-4-methyl-2-oxopentanoate. The product decarboxylates to 4-methyl-2-oxopentanoate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             oxopentanoate.
CATALYTIC ACTIVITY: 3-carboxy-2-hydroxy-4-methylpentanoate +
                                                                                                                                                                                                                                                                                                        Kirino H., Oshima T.;
"Molecular cloning and nucleotide sequence of 3-isopropylmalate
dehydrogenase gene (leuB) from an extreme thermophile, Thermus
aquaticus YF-1.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -!- SIMILARITY: Belongs to the isocitrate and isopropylmalate dehydrogenases family. LeuB subfamily 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 344;

Shelly L.L., Lei K.-J., Pan C.-J., Sakata S.F., Ruppert S., Schutz G., Chou J.Y., Isolation of the gene for murine glucose-6-phosphatase, the enzy deficient in glycogen storage disease type IA."; J. Biol. Chem. 268:21482-21485(1993).
                                                                                                                                                                                                                                                                                                                                                    J. Biol. Chem. 272:11698-11701(1997).
-!- FUNCTION: May be a single membrane channel protein acting bot a hydrolase and a translocase. It is the key enzyme in homeos regulation of blood glucose levels.
-!- CATALYTIC ACTIVITY: D-glucose 6-phosphate + H(2)O = D-glucose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                             Leucine biosynthesis; third step.

Homodimer (By similarity).

AR LOCATION: Cytoplasmic (By similarity).

Y: Belongs to the isocitrate and isopropylmalate nases family. LeuB subfamily 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 470; IDH_IMDH, 1.

Purification of rabbit and human serum paraoxonase.";

Biochemistry 30:10133-10140(1991).

-!- FUNCTION: Hydrolyzes the toxic metabolites of a variety of organophosphate substrates and a number of aromat: carboxylic acid esters. Mediates an enzymatic protection of locensity lipoproteins against oxidative modification.

-!- CATALYTIC ACTIVITY: Aryl dialkyl phosphate + H(2)O = dialkyl phosphate + an aryl alcohol.

-!- CHALVITC ACTIVITY: A phenyl acetate + H(2)O = a phenol + acet

-!- SUBCELLULAR LOCATION: Extracellular.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PTM: Glycosylated.

PTM: The signal sequence is not cleaved.

POLYMORPHISM: There are two allelic forms, allozyme A and B, v differ in their substrate specificity. Both forms have similar arylesterase activity but allozyme B possesses greater paraox activity. Allozyme A is better at protecting LDL from oxidatic SIMILARITY: Belongs to the paraoxonase family.

CAUTION: Ref.3 (AAX06398) sequence differs from that shown due a stop codon in position 355.

The expressed NGOS subunit.";

J. Biol. Chem. 272:4201-4211(1997).

-!- FUNCTION: NDH-1 shuttles electrons from NADH, via FMN and irc sulfur (Fe-S) centers, to quinones in the respiratory chain. immediate electron acceptor for the enzyme in this species is believed to be menaquinone. Couples the redox reaction to protein analocation (for every two electrons transferred, four hydrions are translocated across the cytoplasmic membrane), and to conserves the redox energy in a proton gradient.

-!- CATALYTIC ACTIVITY: NADH + quinone = NAD(+) + quinol.

-!- CATALYTIC ACTIVITY: NADH + quinone = NAD(+) + quinol.

-!- SUBUNIT: COMPOSED OF 14 DIFFERENT SUBUNITS. SUBUNITS NQO7-14

C.-!- SUBCELLUIAR LOCATION: Integral membrane protein.
                                                                                                                                                                                                                                   This SMISS-FROT entry is copyright. Both activities result in ge of the full-length protein and covalent attachment of rol moiety to the C-terminal of the newly generated N-ragment (N-product). This covalent modification appears essential role in restricting the spatial distribution

This covalent modification appears un essential role in restricting the spatial distribution otein activity to the cell surface. The N-product is the ceins in both local and long-range signaling, whereas the has no signaling activity (By similarity).

Y: Belongs to the hedgehog family.
                                                                                                                                                                                                                                                                                                                                                                                                             C-terminal domain displays an autoproteolysis activity slesterol transferase activity. Both activities result in age of the full-length protein and covalent attachment of
                                                                                       ression and shared activities of members of the hedgehog
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          protein; Autocatalytic cleavage; Hydrolase; Protease;

Thalysis of bovine selement (MRE) located in its promoter.";
Gene 199:211-217(1997).

I Gene 199:211-217(1997).

- I- FUNCTION: It constitutes a major selenium pool in the brain it may play an important role in developing and/or modulating the morphology of neurons and/or glial cells.

- I- SUBCELLULAR LOCATION: Secreted (By similarity).

- I- TISSUE SPECIFICITY: Brain and kidney. Most prominently expresion the cerebellar cortex, hippocampus and olfactory bulb.

- I- MISCELLANEOUS: The selenocysteines are all encoded by the oping the content of the cerebellar cortex, hippocampus and encoded by the oping the content of the cerebellar cortex, hippocampus and encoded by the oping the content of the cerebellar cortex, hippocampus and encoded by the oping the content of the cerebellar cortex, hippocampus and encoded by the oping the content of the cerebellar cortex, hippocampus and encoded by the oping the content of the cerebellar cortex, hippocampus and encoded by the oping the content of the cerebellar cortex.

"Genome sequence of the plant pathogen Ralstonia solanacearum.";
In Nature 415:497-502(2002)
--- CATALYTIC ACTIVITY: ATP + 3-phospho-D-glycerate = ADP + 3-phospho-D-glyceroyl phosphate.
--- CATALYTIC Second phase of glycolysis; second step.
--- SUBINAT: Monomer (By similarity).
--- SUBINAT: Belongs to the phosphoglycerate kinase family.
                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright. ```
-!- TISSUE SPECIFICITY: Oocytes.
-!- DEVELOPMENTAL STAGE: Expressed during the 2-week growth phase oogenesis, prior to ovulation.
-!- PTM: Sulfated glycoprotein with 0-linked oligosaccharides.
-!- PTM: Sulfated glycoprotein with 0-linked oligosaccharides.
-!- SIMILARITY: Contains 1 ZP domain.
                                                                                                                                                                                                                                                                                                           This SWISS-PROT entry is copyright. Functions as a sperm-receptor. It is responsible for session to the zona pellucida, and may contribute to the specificity of the insemination.

Both chromophores are non-covalent interactions. Outs: THIS PROTEIN BELONGS: THE "LONG WAVELENGTH-TYPE IS" WITH AN ABSORPTION MAXIMUM AT ABOUT 440 NM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Res. 17:4731-4744(1989).
This enzyme catalyzes the light-dependent monomerization lM) of cyclobuty1 pyrimidine dimers (in cis-syn ion), which are formed between adjacent bases on the strand, upon exposure to ultraviolet radiation.
ACTIVITY: Cyclobutadipyrimidine (in DNA) = 2 pyrimidine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               12; AA TRNA, LIGASE II; 1.
